

Strict and Broad Sensitivity

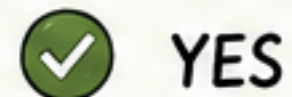

Two questions about probe changes, two different answers.

STRICT SENSITIVITY

Does this item change
when a test detail changes?

Changed?

YES

Different answers.
The item is sensitive.

or

NO

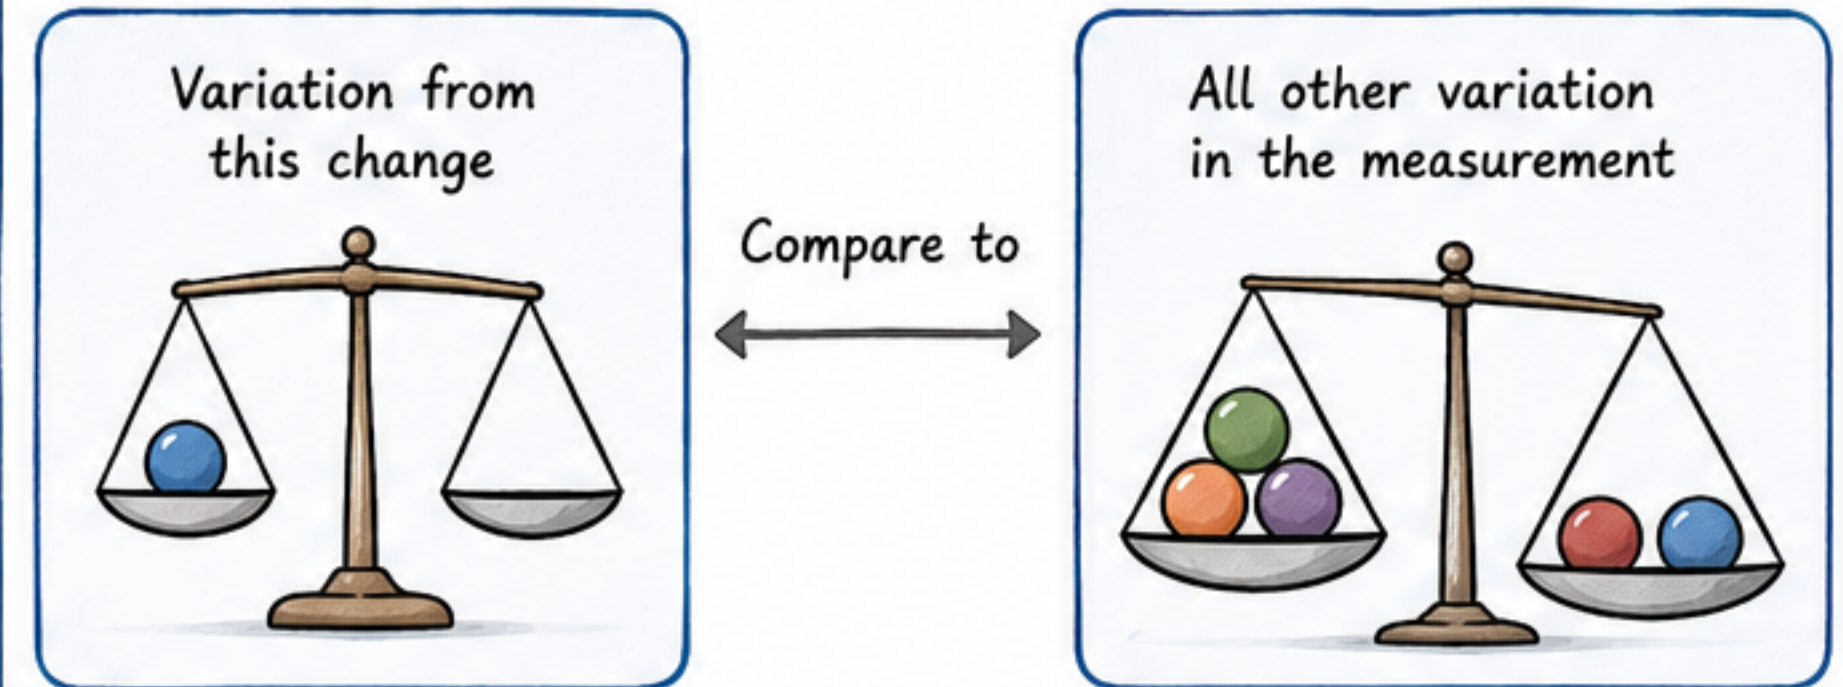

Same answer.
The item is not sensitive.

Focus: Item-level.
A yes / no question.

BROAD SENSITIVITY

How much does that change matter
compared with all other variation?

How large is it relative to everything else?

Focus: Measurement-level.
A proportion on a scale.

In short

Strict sensitivity asks:
Does the item itself change?

Broad sensitivity asks:
How important is that change in context?

Use both to decide
what a score really
tells us.
